## **DETAILED ACTION**

### **EXAMINER'S AMENDMENT**

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Theodosis Kountotsis on 6/30/2011.

The application has been amended as follows:

Claims 6 and 20 are canceled.

1. (Currently Amended) A method of operating a radio network, the method comprising:  
providing a primary station (PS) and a plurality of secondary stations (SS 1, SS2, SS3), determining, via the primary station, an estimated level of interest by users of secondary stations in a service by providing a plurality of random access slots that are selectively configured for permitting a temporary or permanent allocation of a portion of the plurality of random access slots based on the estimated level of interest of the users of the secondary stations, and

indicating, via a secondary station of the plurality of secondary stations, the estimated level of interest by transmitting a predetermined signal in a preselected one of

Art Unit: 2617

the plurality of random access slots, the estimated level of interest based on at least a threshold value [.] ;

wherein each access slot of the plurality of random access slots includes a combination of one time slot and one signature, and wherein the primary station maps each of the plurality of random access slots to a different service such that all the secondary stations interested in one service transmit using one of the plurality of random access slots, and in that each combination of one time slot and one signature is contained in not more than one of the plurality of random access slots.

7. (Currently Amended) The method as claimed in claim 1, wherein each of the plurality of random access slots uses the same signature and in that each random access slot in the plurality of random access slots uses a different time slot.

8. (Currently Amended) The method as claimed in claim 1, wherein each of the plurality of random access slots uses the same time slot and in that each random access slot in the plurality of random access slots uses a different signature.

18. (Currently Amended) A radio network comprising:

a primary station (PS) and a plurality of secondary stations (SS1, SS2, SS3), wherein the primary station (PS) includes means for determining an estimated level of interest by users of secondary stations in a service, the means providing a plurality of random access slots that are selectively configured for permitting a temporary or permanent allocation of a portion of the plurality of random access slots based on the estimated level of interest of the users of the secondary stations,

Art Unit: 2617

wherein a secondary station of the plurality of secondary stations indicates the estimated level of interest by transmitting a predetermined signal in a preselected one of the plurality of random access slots, the estimated level of interest based on at least a threshold value[.] ; and

wherein each access slot includes a combination of one time slot and one signature, wherein the primary station (PS) comprises means for mapping each of the plurality of random access slots to a different service such that all the secondary stations interested in one service transmit using one of the plurality of random access slots, and wherein each combination of one time slot and one signature is contained in not more than one of the plurality of random access slots.

23. (Currently Amended) A primary station for use in a radio network comprising:  
at least one primary station (PS) and a plurality of secondary stations (SS1, SS2, SS3),

wherein the primary station (PS) includes means for determining an estimated level of interest by users of secondary stations in a service, the means providing a plurality of random access slots that are selectively configured for permitting a temporary or permanent allocation of a portion of the plurality of random access slots based on the estimated level of interest of the users of the secondary stations,

wherein a secondary station of the plurality of secondary stations indicates the estimated level of interest by transmitting a predetermined signal in a preselected one of

Art Unit: 2617

the plurality of random access slots, the estimated level of interest based on at least a threshold value[.] ; and

wherein each access slot of the plurality of random access slots includes a combination of one time slot and one signature, and wherein the at least one primary station maps each of the plurality of random access slots to a different service such that the plurality of secondary stations interested in one service transmit using one of the plurality of random access slots, and in that each combination of one time slot and one signature is contained in not more than one of the plurality of random access slots.

24. (Currently Amended) A secondary station for use in a radio network comprising:

a primary station (PS) and a plurality of the secondary stations (SS1, SS2, SS3),  
wherein the primary station (PS) includes means for determining an estimated level of interest by users of secondary stations in a service, the means providing a plurality of random access slots that are selectively configured for permitting a temporary or permanent allocation of a portion of the plurality of random access slots based on the estimated level of interest of the users of the secondary stations,

wherein a secondary station of the plurality of secondary stations indicates the estimated level of interest by transmitting a predetermined signal in a preselected one of the plurality of random access slots, the estimated level of interest based on at least a threshold value[.] ; and

Art Unit: 2617

wherein each access slot of the plurality of random access slots includes a combination of one time slot and one signature, and wherein the primary station maps each of the plurality of random access slots to a different service such that all the secondary stations interested in one service transmit using one of the plurality of random access slots, and in that each combination of one time slot and one signature is contained in not more than one of the plurality of random access slots.

### **Reason For Allowance**

The following is an examiner's statement of reasons for allowance: The closest prior art Van Heeswyk US Patent No. 6,765, 883 in view of Sinnarajah et al. Pub. No. 2004/0008679 and further in view of Salloum Salazar et al. Patent No. 6,700,878 fail to teach the limitation of "wherein a secondary station of the plurality of secondary stations indicates the estimated level of interest by transmitting a predetermined signal in a preselected one of the plurality of random access slots, the estimated level of interest based on at least a threshold value; and wherein each access slot includes a combination of one time slot and one signature, wherein the primary station (PS) comprises means for mapping each of the plurality of random access slots to a different service such that all the secondary stations interested in one service transmit using one of the plurality of random access slots, and wherein each combination of one time slot and one signature is contained in not more than one of the plurality of random access slots." These limitations, in combination of remaining of elements, were not taught nor suggested by the prior art.

Art Unit: 2617

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
